# Linear-in- $\Delta$ lower bounds in the LOCAL model 

Mika Göös, University of Toronto Juho Hirvonen, Aalto University \& HIIT Jukka Suomela, Aalto Univesity \& HIIT

> PODC 16.7.2014

## This work

The first linear-in- $\Delta$ lower bound for a natural graph problem in the LOCAL model

## Fractional maximal matching:

- There is no o( $\Delta$ )-algorithm, independent of $n$
- There is an $O(\Delta)$-algorithm, independent of $n$
( $\Delta=$ maximum degree, $n=$ number of vertices)

## Matching

Matching assigns weight 1 to matched edges and weight 0 to the rest

## Fractional matching

FM is a linear relaxation of matching: weights of the incident edges sum up to at most 1

## Maximal fractional matching

A node is saturated, if the sum of the weights of the incident edges is equal to one

## Maximal fractional matching

The fractional matching is maximal,
if no two unsaturated nodes are adjacent

## Standard LOCAL model

- Synchronous communication
- No bandwidth restrictions
- Running time $=$ number of communication rounds
- Both deterministic and randomized algorithms

## This work

The first linear-in- $\Delta$ lower bound for a natural graph problem in the LOCAL model

## Fractional maximal matching:

- There is no o( $\Delta$ )-algorithm, independent of $n$
- There is an $O(\Delta)$-algorithm, independent of $n$
( $\Delta=$ maximum degree, $n=$ number of vertices)

## Prior work

Coordination problems:

- Maximal matching
- Maximal independent set
- ( $\Delta+1$ )-coloring

Algorithms $O\left(\Delta+\log ^{\star} n\right) \quad$ also $O(p o l y \log (n)$
Lower bounds $\Omega(\log * n)$ and $\Omega(\log \Delta)$
[Linial '92] [Kuhn et al. '05]

## Prior work

Coordination problems:

- Maximal matching
- Maximal independent set
- ( $\Delta+1$ )-coloring

Algorithms $O\left(\Delta+\log ^{*} n\right) \quad$ also $O(p o l y \log (n)$
Lower bounds $\Omega(\log * n)$ and $\Omega(\log \Delta)$
[Linial '92] [Kuhn et al. '05]

## The Proof

## The Proof

## A short guide

- Step 0: Introduce models EC, PO, OI and ID
- Step 1: $\Omega(\Delta)$-lower bound in the EC-model
- Step 2: Simulation result $\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID}$
- Step 3: ID $\rightarrow$ Randomized algorithms

## The Proof

## A short guide

- Step 0: Introduce models EC, PO, OI and ID
- Step 1: $\Omega(\Delta)$-lower bound in the EC-model
- Step 2: Simulation result $\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID}$
- Step 3: ID $\rightarrow$ Randomized algorithms

## Edge coloring (EC)

$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## Port-numbering and orientation (PO)

$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## Port-numbering and orientation (PO)

$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## Unique Identifiers (ID)

$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{Ol} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## Order Invariant (OI)

$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## The Proof

## A short guide

- Step 0: Introduce models EC, PO, OI and ID
- Step 1: $\Omega(\Delta)$-lower bound in the EC-model
- Step 2: Simulation result $\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID}$
- Step 3: ID $\rightarrow$ Randomized algorithms

## Loopy graphs

A graph is $k$-loopy, if it has at least $k$ self-loops at each node
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## Loopy graphs

Loopy graphs are a compact representation of simple graphs with lots of symmetry
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## Loopy graphs

A loopy graph can be unfolded to get a simple graph
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## Loopy graphs

A loopy graph can be unfolded to get a simple graph
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## Loopy graphs

loopy graphs $\approx$ infinite trees
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## Loopy graphs

Key observation: a maximal fractional matching must saturate all nodes of a loopy graph!
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## EC lower bound

$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## EC lower bound

GG

GH

HH
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## EC lower bound

$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## The Proof

A short guide to the proof

- Step 0: Introduce models EC, PO, OI and ID
- Step 1: $\Omega(\Delta)$-lower bound in the EC-model
- Step 2: Simulation result $\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID}$
- Step 3: ID $\rightarrow$ Randomized algorithms

## $\mathrm{EC} \rightarrow \mathrm{PO}$

## $\mathrm{EC} \rightarrow \mathrm{PO}$

Assume we have an o( $\Delta$ )-time algorithm $\mathbf{A}$ for maximal edge packing in the PO model
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## $\mathrm{EC} \rightarrow \mathrm{PO}$

Transform EC graph into PO graph by replacing each edge with two oriented edges
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## $\mathrm{EC} \rightarrow \mathrm{PO}$

Simulate the PO-algorithm $\mathbf{A}$ and combine the weights of the corresponding edges
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## $\mathrm{EC} \rightarrow \mathrm{PO}$

We get an o( $\Delta$ )-algorithm in the EC-model, which is a contradiction
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$
$\mathrm{PO} \rightarrow \mathrm{Ol}$

## $\mathrm{PO} \rightarrow \mathrm{Ol}$

- Similar technology as Göös et al. (2012)
- Now we do not need any approximation guarantees
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## $\mathrm{PO} \rightarrow \mathrm{Ol}$

Assume we have a PO-algorithm $\mathbf{A}$
We use port numbers and orientation to get a local ordering
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## $\mathrm{PO} \rightarrow \mathrm{Ol}$

G

U(G)

Take the universal cover of $G$
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

$$
\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}
$$

## $\mathrm{PO} \rightarrow \mathrm{Ol}$

It is possible to make a PO-graph an Ol-graph locally
Use this to simulate $\mathbf{A}$
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

$$
\mathrm{Ol} \rightarrow \mathrm{ID}
$$

## $\mathrm{Ol} \rightarrow \mathrm{ID}$

> Use the OI $\rightarrow$ ID lemma of
> Naor and Stockmeyer (1995)
> (essentially Ramsey's Theorem)

The idea is to force any ID-algorithm $\mathbf{A}$ to behave like an Ol-algorithm on some inputs
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## $\mathrm{Ol} \rightarrow \mathrm{ID}$

Trick: consider an algorithm $\mathbf{A}^{*}$ that simulates $\mathbf{A}$ and outputs 1 at saturated nodes and 0 elsewhere to apply the Lemma

This forces all nodes to be saturated in $\mathbf{A}$ in loopy neighborhoods

Any change must propagate outside A's run time $\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathrm{R}$

## The Proof

## A short guide

- Step 0: Introduce models EC, PO, OI and ID
- Step 1: $\Omega(\Delta)$-lower bound in the EC-model
- Step 2: Simulation result $\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID}$
- Step 3: ID $\rightarrow$ Randomized algorithms

## Randomized algorithms

Idea: Reduce random algorithms back to deterministic ones

Again use a lemma of Naor and Stockmeyer (1995)
$\mathrm{EC} \rightarrow \mathrm{PO} \rightarrow \mathrm{OI} \rightarrow \mathrm{ID} \rightarrow \mathbf{R}$

## Summary

## This work

Fractional maximal matching has complexity $\Theta(\Delta)$

## Open questions

What is the complexity of maximal matching?
What is the complexity of 2-colored maximal matching?
